## OTCnet 1.2.4.A Release Notes

### OTCnet 1.2.4.A Release Overview

The OTCnet Team has made modifications to the OTCnet Online and Offline Check Capture application.

### Check Scanning and Processing

#### *Online Application*

##### Check Capture

- Automated Terminal Detection now functions properly when the following Java Security Settings are enabled within the Java Control Panel:
  - Check certificates for revocation using Certificate Revocation Lists (CRLs)
  - Enable online certificate validation
- Response time is slightly improved when a user selects the Save button on the Check Scan page to save check images and details. This modification updates a query to improve the performance of check saving when a user enters common whole values for a check, such as \$100.00, \$50.00, or \$1500.00 during check scanning (all other dollar amounts are not impacted and the saving times are acceptable). A full solution to bring the common whole value check saving time to an acceptable level will be implemented in an upcoming release, scheduled for June 2012.

#### *Offline Application*

##### Check Capture

- Users are able to upload check items with MICR Line parts that are not separated by a space through the Offline Batch Upload process without issue.
